Process Discovery Version 1.60.0 Release Notes

Review the new features and fixes available in this release.

Release Date: 10-January-2023

For information related to features and fixes in previous Process Discovery releases, see the PDFs for these releases: Process Discovery documentation (release versions).

Features

For Kibana and Process Discovery users, the observer activity log data is automatically generated and synchronized across all environments in the Canada, United Kingdom, and Australia regions.

From the Mining Runs page, you can select users that have created mining runs using the Created By field. The Created By field is available from the Filters button. You can select multiple users from the drop-down, and the filter displays a list of all applicable users by first and last name.

Fixes

From the Events page, you can use the Filter option to apply the Observed At rule for any date in the date field without errors. Previously, when you selected the Observed At rule, the pre-filled date would not apply to the filter if the date picker was not open, and a date was not selected.

When you access the platform to log in, you are redirected to the Process Discovery platform. When attempting to redirect to a personal website, we added the URL to a list of domains that are allowed for safeguarding.

From the Application Strategy page, you can rename merged signatures. Previously, if you edited a provisional signature, renamed the signature, and then selected merge signatures to have the name be the same, it would not use the new name.

From the Instances Viewer page, you can export the selected instance with the correct data. Previously, if you selected a path from the Paths button, any path was selected at random and exported.

From the Observers page, you can enable and then disable an observer's recording from the Actions menu by selecting, Automatically Record New Observers For This User, and the disabled state is displays correctly with a red dot. Previously, when you selected Automatically Record New Observers For This User, and then disabled the recording by selecting Do Not Automatically Record New Observers For This User, the enabled state (green dot) did not update correctly to the disabled state (red dot).

From the Signature Service Jobs page, the sorting of signature service jobs using the TYPE column is no longer supported.
